

Personal Framework: Seeing Myself as an AI/ML Change Leader

Rita Khadka

Course: Machine Learning Fundamentals

Workshop: 6.5 Assignment Personal Framework – Seeing Myself as a Change Leader

Introduction

At the beginning of this course, when I completed my personal assessment, I viewed change management and leadership skills as challenging areas for me. The assessment helped me identify my strengths and weaknesses. My main strengths were resilience, understanding organizational culture, and continuous learning. I think resilience is important because it helps me stay positive and adapt when challenges come up. Understanding organizational culture also helps me understand how changes can affect employees, teamwork, and the organization.

The assessment also showed me the areas where I need improvement. My main areas for growth were communication, conflict resolution, and project management. I also wanted to improve my communication with stakeholders during AI/ML initiatives and learn more about change readiness for AI integration. Although I had a good understanding of AI and machine learning concepts, I wanted to continue building my knowledge as technology continues to change.

Throughout this course, I learned more about AI/ML and how leadership is also important when implementing AI. Initially, I saw AI mainly as a model that is trained using data. After this course, I learned that AI is not only about the model or data, but it also matters what type and quality of data is used. I also learned about bias, privacy, transparency, ethics, and the responsible use of AI.

Through the assignments and discussions in this course, I learned to think beyond the technical side of AI. I learned that even if an AI system works well technically, it is still important to think about how it can affect people and organizations. This course also helped me understand that AI/ML integration requires communication, collaboration, leadership, and change management. It changed how I think about leadership because I learned that an AI/ML leader should not only focus on technology but also help people understand and adapt to the changes that AI can bring.

Mission Statement

My mission as an AI/ML leader is to use my technical background and knowledge to help organizations adopt AI in a responsible and ethical way. I want to continue improving my leadership and communication skills so that I can work effectively with both technical and non-technical teams. My goal is to help organizations use AI while also considering ethics, people, and business needs.

Core Values

Some of the core values that will guide me as an AI/ML leader are ethics, transparency, collaboration, accountability, integrity, and continuous learning.

Ethics is important to me because AI can have a big impact on people and organizations. I believe that AI should be used responsibly, and it is important to think about how data is used and whether AI can create unfair or harmful results. Transparency is also important because people should have an understanding of how AI is being used, especially when it affects decisions.

I also think collaboration is important because AI/ML projects require technical and non-technical people to work together. This is also one of the areas where I want to improve my communication skills. Accountability and integrity are important because they will help me take responsibility for my decisions and actions. These values connect with my personal ethics and faith because I believe in being honest, responsible, and respectful toward others. Continuous learning is also important to me because AI and technology continue to change, and I want to continue improving my technical and leadership skills.

Key Objectives

Over the next year, I plan to continue developing my AI/ML knowledge by taking additional courses, completing certifications, or working on hands-on projects. I also want to continue learning about the ethical and responsible use of AI, including privacy, transparency, bias, and responsible data use.

Another objective is to improve my communication skills. Communication was one of the areas where I needed improvement in my initial assessment. I want to practice explaining technical AI concepts in a simple and clear way, especially when communicating with non-technical stakeholders.

I also want to continue improving my leadership, project management, and change management skills. Over the next one to two years, I plan to participate in cross-functional projects and learn from people with more experience.

Action Plans

In the short term, I will continue taking courses, working on projects, and reading resources related to AI/ML. I will also continue learning about the responsible use of AI and think about privacy, transparency, bias, and ethical data use when working on AI-related projects.

To improve my communication and leadership skills, I will practice explaining technical concepts more clearly and seek feedback from managers, mentors, professors, and colleagues. I also plan to participate in cross-functional projects because working with people from different backgrounds can help me improve my communication and collaboration skills.

In the long term, I want to apply my AI/ML knowledge to real-world projects and continue developing my leadership and change management skills. I also plan to seek mentorship and continue learning as AI technology changes. My goal is to combine my technical background with stronger leadership skills so that I can help organizations adopt AI in a responsible and effective way.

Evaluation and Adaptation

I plan to review my goals every three months to track my progress and identify areas where I need improvement. I will also ask for feedback from managers, mentors, professors, and colleagues and complete a self-assessment once a year. Since AI technology and my career goals may change, I will update this framework when needed and continue learning and improving as an AI/ML leader.
